

1 • SENTINELAI

Autonomous AI Security Operations Center

Detect • Investigate • Assess • Respond • Verify

2 • THE PROBLEM

Security teams drown in noisy logs. Repeated authentication failures, scans and suspicious traffic require correlation, context and prioritization.

SentinelAI turns events into decisions.

3 • THE SOLUTION

A multi-agent SOC orchestrator coordinates specialist agents to detect, investigate, assess risk, map MITRE ATT&CK; and prepare a safe response.

4 • SYSTEM ARCHITECTURE

Sources → Normalize → Planner → Log Analysis → Threat Detection → Threat Intel → Investigation → Risk → MITRE
→ Response → Human Approval → Verify

5 • WHY IT IS AN AI AGENT

Not User → LLM → Answer.

Instead: Observe → Reason → Plan → Delegate → Act (controlled) → Verify.

6 • SPECIALIST AGENTS

Log Analysis • Threat Detection • Threat Intelligence • Investigation • Risk Assessment • MITRE Mapping • Incident Response • Verification • Human Approval

7 • FLAGSHIP DEMO

60 synthetic failed SSH logins from one IP → brute-force detection → IOC enrichment → critical risk → T1110 → approval → controlled containment → verification.

8 • CUSTOMER VALUE

Reduce repetitive triage • standardize investigations • prioritize risk • preserve evidence • keep consequential actions under authorization.

9 • TARGET AUDIENCE

SMBs • Universities • MSSPs • IT/Security Teams • SaaS/Cloud Teams

10 • PRODUCT ROADMAP

Starter: local logs. Pro: SIEM/TI + alerts. Enterprise: RBAC/SSO + multi-tenancy + immutable audit + cloud + secure response connectors.

11 • DEMO SCRIPT

Launch demo → analyze → Agent Command Center → Investigation → Response → Approve → Execute → Verify → Report.

12 • CLOSING

SentinelAI — from raw telemetry to verified action.

Defensive today. Product-ready foundation for tomorrow.
